Investigations of the morphology and dynamics of single bacteriophage MS2 capsids using atomic force microscopy. The use of atomic force microscopy (AFM) to investigate the structural dynamics of single bacteriophage MS2 virus particles was investigated. AFM was used to examine intact single MS2 particles in air. AFM was also used to compare the structural features of individual MS2 virions with those of MS2 cores. The results obtained demonstrate that individual MS2 virions in air are pleomorphic and that the overall morphology is not conserved between different virus preparations. Investigation of the structural dynamics of individual MS2 particles revealed that the virion is weakly flexible and shows a certain degree of thermal stability. The results obtained also suggest that the tails of the virions are flexible and that the tails can flip back and forth during viral ejection. Finally, MS2 cores were imaged and compared with MS2 virions. The results obtained suggest that the MS2 core differs from the capsid and the tail components. MS2 cores are very stable and immobile in air. In contrast to MS2 virions, MS2 cores appear very rigid, thereby suggesting a different structural organization and perhaps a different mode of assembly. The results obtained are also consistent with observations reported by cryo-electron microscopy on MS2 cores. Q: Closing TclX objects (e.g. channels) I have a thread-based backend to a tcp server, handling multiple clients at a time, using Tcl-X. There are some cleanup tasks that I need to run on shutdown, and I want to accomplish this without having to manually tell the backend to shutdown, because when the backend is shut down, it will also kill all the other threads and objects I have associated with it. Since this code doesn't return I don't have a chance to close the sockets, etc, how would I accomplish this? A: You have to stop the
